Foreword

In 2013, the Ministry of Planning / Kurdistan Region Statistics office published the estimated population report for the Kurdistan Region for the years 2009-2020 in cooperation with the United Nations Population Fund (UNFPA) after the General Population and Housing Census was not implemented as planned in 2010. In estimating the population numbers, the report relied on the results of the listing and numbering process for the year 2009 as well as on the results of the (Multiple Indicators Cluster (MICS) survey 2011 Poverty mapping and Maternal Mortality (IPMM) 2012. In 2019, the Federal Ministry of Planning announced its decision to carry out the census in 2020, but for various reasons, this decision has not been implemented and the census has not been implemented to this day.

The failure to implement a general census of population and housing in Iraq for 35 years has caused a large gap in an important source of planning data due to the lack of demographic indicators in their details, and therefore the statistical agencies in the country were forced to adopt alternative methods to provide these indicators using indirect population assessment programs in order to help the ministries in the Kurdistan Regional Government develop their annual plans and policies.

Therefore, the Statistics office prepared the population estimation report for the years 2021-2040 in cooperation with the United Nations Population Fund (UNFPA), benefiting from the latest data and indicators from the Demographic Survey 2017 and the Multiple Indicators Cluster Survey 2018 (MICS). This report differs from its predecessor in that it includes more details in terms of estimating the number of IDPs and refugees in the Kurdistan Region, who were embraced by the region after 2013, with an estimate of the population numbers at the district level so that Ministries and governorates can prepare their programs for administrative units and not only for governorates as a whole.

Here, I find it necessary to extend my thanks to the United Nations Population Fund (UNFPA) for its technical and material cooperation with the Kurdistan Region Statistics Office (KRSO), especially Dr. Magued Othman, former Minister of Communications and Information Technology and a demographic and census expert in Egypt, and I appreciate his cooperation in preparing this report. I extend my sincere thanks to Dr. Mahdi Al-Alak, National Census Advisor at UNFPA, for his review and evaluation of this report.

I extend my thanks to Mr. Serwan Mohamed, president of the Kurdistan Region Statistics Office (KRSO); Gohdar Mohammad Ali, head of the Population and Labor Force Statistics department; and Naeemah Akram, the department employee; who worked in preparing this important report, which is of great benefit and will be an essential source for developing plans and programs of ministries and governorates in the Kurdistan Regional Government.

**Dr. Dara Rasheed
Minister of Planning**

Preamble

Demographic data is a necessity for the development of population policies as a source of development in countries, hence the importance of population censuses and are implemented by statistical agencies every 10 years, as it is considered the largest statistical process.

During 35 years, Iraq has not been able to implement a comprehensive population and housing census, so it was necessary to resort to statistical surveys to provide demographic data and indicators. The Statistics office did its duty to fill part of this gap and prepared a report estimating the population numbers in the region for the years 2021-2040 and we tried to include the largest number of data and indicators such as age groups, life expectancy and male and female ratios not at the regional and governorate levels, but at the urban and rural levels as well.

The population estimate report is not a substitute for the census because it doesn't include everything with details and this is due to depending on the data available during the preparation of the report, so when recent data is available, it is necessary to review the population estimates and make changes, if any.

From this standpoint and in order to deliver the greatest benefit, three scenarios of population growth were developed in the report for the entire region and governorates under the heading of low, medium and large growth.

This report is adopted for the first time in Iraq and its importance lies in the fact that policy and plan makers will be able to draw their programs and expectations based on the results of this report and adapt them with reality of the population situation.

We hope that as we have always been accustomed to, we have set a clear vision in front of the Ministry of Planning to benefit from the latest demographic data and indicators, as well as enable us to help the ministries that are the main users of these data and indicators.

Serwan Mohammad

President

KRSO

Evaluation

Identifying the projections of population and their age and sex distribution on the administrative, rural and urban level is an important method to develop strategies and plans especially those related to the local development – on district level - .With the unavailability of up-to-date data due to the failure in conducting a comprehensive population census since 1987, providing population projections for the upcoming years involves some apprehension if not being conducted on scientific, real and accurate bases.

This report is built on demographic hypotheses characterized with reality and objectivity. Dr. Majid Othman, the editor of this report tried to check on the most appropriate hypotheses in the light of an in-depth extrapolation of the KR population characteristics based on the statistical indicators provided by Kurdistan Region Statistics Office.

The methodology of this report is a useful source for the different official authorities, researchers and studies centers since it provided projections on KR district level for an appropriate period of time. But this does not preclude reviewing the results of the report after Iraq conducts the next census that expected to be conducted during the next two years based on what was stated in the new government curriculum.

Adopting the evidence-based methodology of the key indicators in building the new demographic models supports the importance of the KR population projection's report.

We hope that the official and non- official authorities benefit from this report in a way that enhance the process of planning and development.

D. Mahdi Al-alak
National Advisor on Census Affairs at the
United Nations Population Fund (UNFPA)

Introduction

Iraq has witnessed accumulative crisis since 2014 resulting in shifts of the demographic profile of the country. There have been major changes on key population factors including population growth, distribution, age structure, fertility, mortality, population mobility, women empowerment etc. In addition, the COVID19 pandemic made even more implications on the demographic factors. The long-term conflict in Iraq has negatively impacted the economic outlook for the country, including the Kurdistan Region, as foreign investment has decreased, and trade routes have been disrupted. During the last decade, KRI faced additional challenges including inflow of Syrian refugees, displacement due to the ISIL invasion of Iraqi territories, budget disputes between the KRG and Iraq's Federal Government and decreasing oil prices.

These challenges had a negative impact on government function, household resilience, private sector survival, and distortion of the labor market in the Kurdistan Region of Iraq. Furthermore, they put the region's government under immense strain, particularly with respect to the provision of public services and social protection. With all these challenges, KRI was faced with an unexpected global pandemic that placed more pressures not only on the health sector but also on the economy at large.

The current report on "Population Projections for Kurdistan Region of Iraq on the district level 2021-2040" aims at supporting economic and social planning on the district level by projecting the population by age and sex. The perceived impact of population dynamics is important to provide services and infrastructure whether in the planning phase or in revising priorities and resource allocation. It is a crucial step to achieve sustainable development and to make sure no one is left behind.

Methodology

Estimation of population data and indicators on the governorate and district levels

The 2020 baseline population used in this report was provided by the KRSO. According to this data the population of the Kurdistan Region is nearly 6.2 million inhabitants. Erbil is the largest governorate in the region hosting nearly 36.5% of the total population of the region, followed by Sulaymaniyah (34.9%), then Duhok (26.7%) and Halabja (1.9%). The sex distribution is balanced with 50.2% males among the region with slight discrepancy across governorates.

Table 1: Population of KRI by governorate, 2020

Governorate	Male	Female	Total
Erbil	1,138,143	1,116,279	2,254,422
Sulaymaniyah	1,076,829	1,075,766	2,152,595
Duhok	826,100	822,511	1,648,611
Halabja	57,756	57,699	115,455
KRI	3,098,828	3,072,255	6,171,083

The age structure of Kurdistan is reflecting a young population structure with nearly 37% below 15 and 29 % between 15 and <30 years. This young age structure will be echoed on a high dependency rate and is consistent with fertility levels. According to the 2018 MICS results, the total fertility rate was 3.1 child per woman in Erbil, 2.8 in Sulaymaniyah and 3.7 in Duhok. The fertility level of Duhok is equal to the national level (3.7 child per woman)¹, and fertility level is significantly lower in Erbil and in Sulaymaniyah. Compared to the neighbour countries, Iran and Turkey have a significantly lower fertility level (2.2 child per woman and 2.1 child per woman respectively.)

Planning on district level should recognize the local differentials in population structure across governorates, as population structure impact economic and social planning. Table 2 shows that the population structure varies across the three governorates. For example, Duhok has a younger population with 41% below 15 while Sulaymaniyah has 34% of its population below 15. This shows that taking population dynamics into consideration will improve the socio-economic planning process and will result in a more accurate resource allocation process that is responding to the need of the people of KRI.

The detailed (5 year) age and sex distribution for the population of each governorate (Table 3) is used as the baseline population in projecting the population up to year 2040. To project the population on the district level, data included in Table (4) are used as the baseline for projecting the population from 2020 to 2040.

Source: MICS 2018

According to the International Organization for Migration (IOM), internally displaced population (IDP) in Iraq reached 1.18 million as of mid-2022². KRI share of IDP's is nearly 694 thousand individuals, i.e., 52.6% of IDP's in Iraq. The following features characterize IDP's in the region:

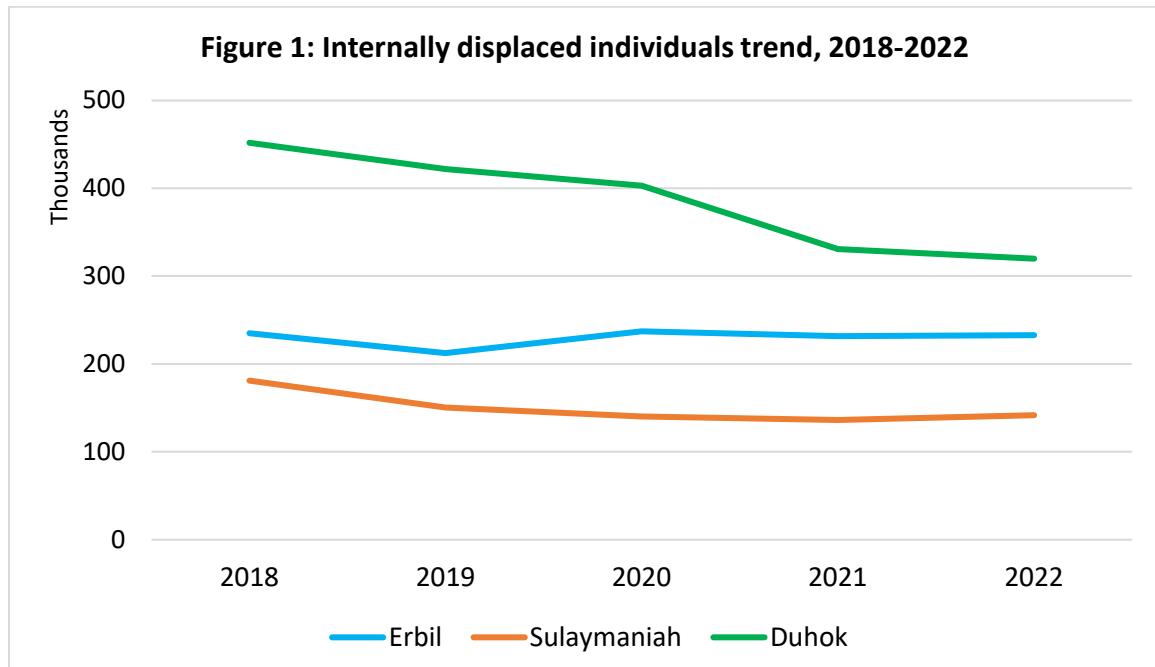

- 1) Geographical differential across governorates. Data³ show that Duhok has the highest number of IDP's within the KRI (320 thousand IDP's) hosting 46% of total IDP's living in KRI. Erbil comes second with 233 thousand IDP's representing 34% of total IDP's living in KRI, followed by Sulaymaniyah that host 142 thousand IDP's, i.e., 20% of total IDP's living in KRI.
- 2) Burden of IDP's on hosting population. When the burden of IDP's is measured as the percent of IDP's to the population of each governorate, it was found that based on the 2020 data, the percent was significantly higher in Duhok (24.4%) followed by Erbil (10.5%) then Sulaymaniyah⁴ (6.2%).
- 3) Trend. As illustrated in Figure (1) and analysed in Table (6), the total number of IDP's hosted in the region decreased by 20% between February 2018 and March 2022. The decrease in the number of IDP's in Duhok was higher reaching 29%, followed by Sulaymaniyah (22%) while the number of IDP's in Erbil seems to stabilize.
- 4) Governorate of origin for IDP's. The distribution of IDP's by governorate of origin differs across governorates. Nearly all IDP's residing in Duhok are from Ninewa governorate, while IDP's living in Erbil and Sulaymaniyah are more heterogeneous in terms of governorate of origin. In Erbil, 48% moved from Ninewa governorate, 30% from Anbar, and 10% from Salah Al-Din Governorate. IDP's living in Sulaymaniyah are even more heterogeneous (24% from Salah Al-Din, 22% from Baghdad, 18% from Diyala, 16% from Anbar and 10% from Ninewa.)

² <https://iraqdtm.iom.int/Dashboard>

³ March 2022

⁴ Including Halabja

These figures show that future scenario building for the KRI population should consider the possible changes in the number of IDP's on the governorate level. Such changes do not depend only on the political, economic and social situation in KRI but depends heavily on the situation in the governorates of origin and on the political stability in neighbour countries.

Population projections technique

Population projections are estimates of the population for future years. They are typically based on an estimated population consistent with the most recent decennial census and are produced using the cohort-component method. Projections illustrate possible courses of population change based on assumptions about future births, deaths, net international migration, and internal migration. In some cases, several series of projections are produced based on alternative assumptions for future fertility, mortality, net international migration, and (for state-level projections) state-to-state or internal migration⁵.

In the cohort-component method, the components of population change (fertility, mortality, and net migration) are projected separately for each birth cohort (persons born in a given year). The base population is advanced each year by using projected survival rates and net international migration, and each year, a new birth cohort is added to the population by applying the projected fertility rates to the female population.

For each of the three components of population changes, the level and pattern need to be carefully assumed to reflect the changes expected during the period of projections. Fertility assumptions should identify the level of fertility (total fertility rate) and the pattern of fertility (age specific fertility rates). Mortality assumptions should identify the level of mortality for both sexes (life expectancy by sex) and the pattern of mortality (age specific mortality rates by sex). Similarly, migration assumptions should identify the rate of migration and its pattern. The level and pattern of fertility is usually derived from a recent survey, and a model life table is selected to reflect the age specific mortality rates. Migration assumptions depend on economic and political prospects. Spectrum software was used to generate the population projections.

In a recent report⁶, the KRI population projections were conducted for a 20-year period starting from 2020. The projections benefited from a previous set of projections conducted by KRSO in 2013⁷. The previous set of projections covers the period 2009 to

⁵ <https://www.census.gov/programs-surveys/popproj/about.html>

⁶ [Kurdistan Region of Iraq - Population Analysis Report 2021 \(gov.krd\)](#)

⁷ KRSO (2013). Population projection for Kurdistan Region of Iraq 2009 to 2020. [In Arabic]

2020. The current projections used the resulting 2020 population by age and sex as the base year for projecting the population of KRI to 2040.

In the current report, population projections were developed on the district level for both urban and rural areas. To be able to project the population for each of the 33 districts separately, there is a need to compute the parameters of the population projections on the district level. As such data on small areas are not available, the projections were conducted on the governorate level and then the results were distributed among districts (urban and rural) proportional to their population size at the baseline. This assumption implies that districts within the same governorate are homogeneous in terms of parameters of population dynamics.

Scenarios for population projections on the governorate level

A set of scenarios were developed for each governorate. Regarding fertility, data from the MICS survey (2018) showed that the total fertility rate is higher in Duhok (3.7), followed by Erbil (3.1), then Sulaymaniyah (2.8). The total fertility rates are assumed to decrease over time according to three scenarios. The trajectory was based on a higher fertility level in Duhok and a lower fertility level in Sulaymaniyah and Halabja. The 2018 data was extrapolated to year 2040 using 3 scenarios. The first scenario (high variant fertility) assumes an annual decrease of 0.5%, the second scenario (medium variant fertility) assumes an annual decrease of 1%, and the third scenario (low variant fertility) assumes an annual decrease of 2%. As presented in Table 8, the 2040 total fertility rate will vary from 1.99 to 2.78 child per women in Erbil, from 1.80 to 2.51 child per women in Sulaymaniyah and in Halabja, and from 2.37 to 3.31 child per women in Duhok. The age specific fertility rates derived from the KRI Demographic survey⁸ were applied to the set of TFR's and used for the projections of the four governorates.

The life expectancy at birth was assumed to be equal across the four governorates as no data is available on the governorate level. The scenario assumes an increase from 73.7 years in 2020 to 77.5 in 2040 for males and from 76.5 years to 80.6 years for females over the projection period (Table 9.) Life expectancy at birth, indicates overall mortality in a population. In addition, the pattern of mortality is needed to produce mortality rates by age group. The rates required to conduct the population projections are survival ratios. Accurate and recent age/sex specific mortality rates are not available in many countries on the national level and less likely to be available on the sub-national level. Alternatively, model life table are used. The UN General life table is used as it is based on estimates of country specific data.

⁸ Table 18

Table 8: Total fertility rate scenarios by governorate

Governorate	Variant	2020	2025	2030	2035	2040
Erbil	High	3.07	2.99	2.92	2.85	2.78
	Medium	3.04	2.89	2.75	2.61	2.49
	Low	2.98	2.69	2.43	2.2	1.99
Sulaymaniyah	High	2.77	2.7	2.64	2.57	2.51
	Medium	2.74	2.61	2.48	2.36	2.24
	Low	2.69	2.43	2.2	1.99	1.8
Duhok	High	3.66	3.57	3.48	3.4	3.31
	Medium	3.63	3.45	3.28	3.12	2.97
	Low	3.55	3.21	2.9	2.62	2.37
Halabja	High	2.77	2.7	2.64	2.57	2.51
	Medium	2.74	2.61	2.48	2.36	2.24
	Low	2.69	2.43	2.2	1.99	1.8

Table 9: Life expectancy scenario 2020 to 2040

	2020	2025	2030	2035	2040
Male	73.7	74.8	75.7	76.6	77.5
Female	76.5	77.5	78.5	79.6	80.6

Limitations

Results of any population projections depend on the assumptions adopted and on the baseline data. Accordingly, users of the results should consider the following:

- 1) Results of the population projections need to be updated when new data suggest different assumptions or different baseline age and sex population data. For example, results of new census or surveys need to be taken into consideration to update the results, especially if there are significant deviations between the assumptions/results of the projections and the new set of data.
- 2) Population projections of small geographical areas (district level) assumed that population dynamics parameters are equal within the same governorate, this assumption is adopted due to the lack of data on the district level. If new data indicate heterogeneity within the governorate, then population projections need to be updated.
- 3) Internally displaced population depends on political stability in Iraq and in neighbour countries. It also depends on the economic situation in KRI and in other governorates. The net inflow/outflow of IDP's need to be measured periodically as it might affect the results of the future population size not only on the Kurdistan Region level but also on the governorate level.

Therefore, the population projection results should be considered as a living (dynamic) document that needs to be updated whenever new data are made available, or, if significant changes occur due to political/economic/environmental factors.

Results

Population projection for Kurdistan Region of Iraq

To conduct the population projections for KRI population up to 2040, a set of scenarios are considered. Three scenarios are applied for the fertility level. A sensitivity analysis didn't suggest a large difference between the three scenarios and accordingly the medium fertility scenario was used for the projections on the district level (Table 10 summarises the results).

Table 10: Population of KRI by governorates, medium fertility variant, 2020-2040
Numbers

	2020	2025	2030	2035	2040
Erbil	2,254,421	2,488,315	2,731,945	2,981,511	3,232,154
Sulaymaniyah	2,152,597	2,348,728	2,549,373	2,748,771	2,938,720
Duhok	1,648,613	1,859,753	2,093,015	2,342,886	2,600,612
Halabja	115,454	125,974	136,736	147,431	157,618
KRI	6,171,085	6,822,770	7,511,069	8,220,599	8,929,104

Percent					
	2020	2025	2030	2035	2040
Erbil	36.5%	36.5%	36.4%	36.3%	36.2%
Sulaymaniyah	34.9%	34.4%	33.9%	33.4%	32.9%
Duhok	26.7%	27.3%	27.9%	28.5%	29.1%
Halabja	1.9%	1.8%	1.8%	1.8%	1.8%
KRI	100.0%	100.0%	100.0%	100.0%	100.0%

Forecasting IDP's

These previous results assumed that the proportion of IDP's will remain constant during the period of population projections. Two other scenarios were considered to make the results more useful for policy makers and planners. The two scenarios assume a decrease in the number of IDP's and follow the discussion presented in the previous section. Based on the recent trend observed for the number of IDP's, the first additional scenario assumes a linear decrease in the number of IDP's in each governorate and the second assumes a proportional decrease.

According to the linear decrease scenario, the number of IDP's will decrease in KRI from 694 thousand in 2022 to 224 thousand in 2040, while according to the proportional decrease scenario the number of IDP's is expected to be 338 thousand in 2040 (Table 11.) Figure 2 illustrates the expected disparity in the geographical distribution of IDP's across governorates

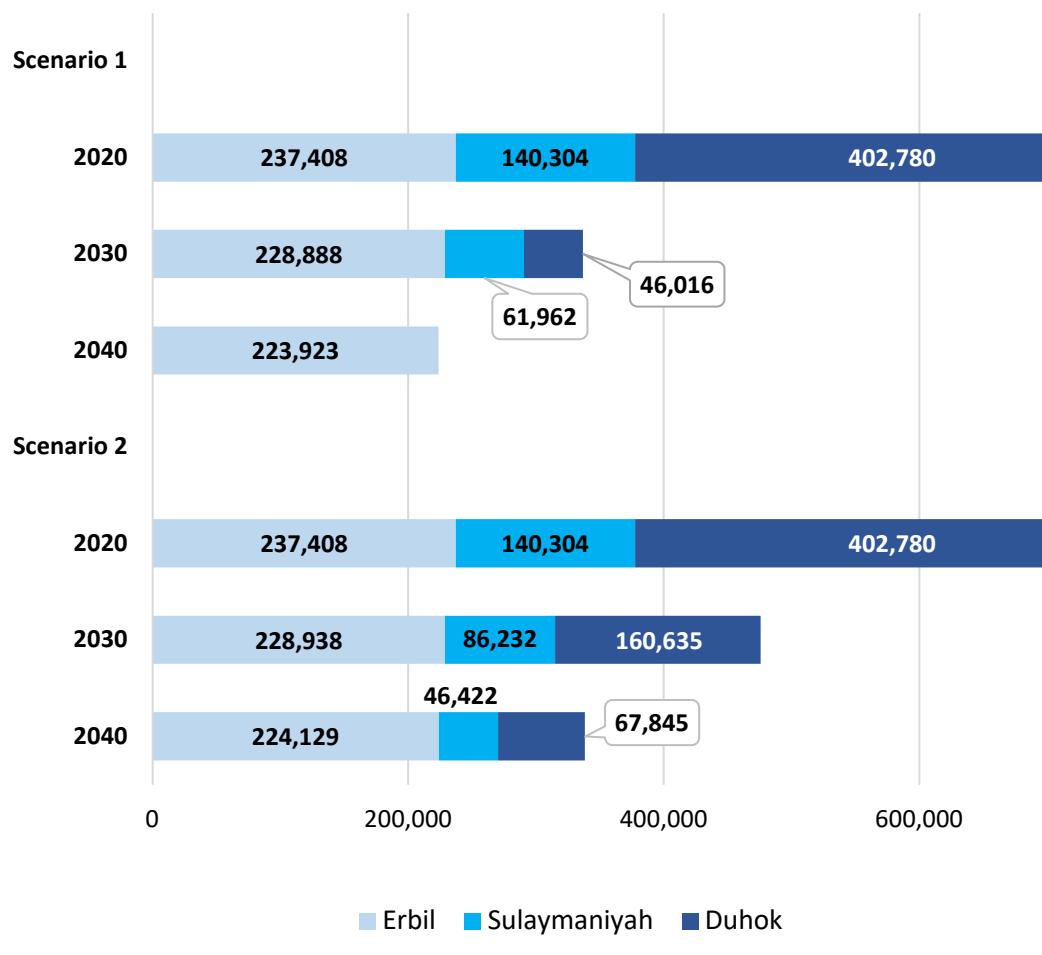

and how this distribution will change over time⁹. The decreasing trend observed during the period 2018-2022 showed a significant discrepancy across governorates. Erbil that was hosting in 2020 30% of all IDP's living in the region, is expected to host between 66% (proportional decrease scenario) and 100% (linear decrease scenario) in 2040. Sulaymaniyah will witness a slower pace of decrease as the proportion will decrease from 18% in 2020 to 0% (linear decrease scenario) and to 14% (proportional decrease scenario) in 2040. A dramatic decrease in the number of IDP's currently living in Duhok is expected to take place if the recent trend (2018-2022) continues, as the proportion of IDP's living in Duhok in 2020 was 52% and is expected to drop sharply to 20% under the proportional decrease scenario while under the linear decrease scenario there will be no IDP's in Duhok.

Table 11: Scenarios for changes in IDP's across governorates

	Linear decrease				Proportional decrease

Population projections for Erbil Governorate

Erbil Governorate hosts the capital of the Kurdistan Region of Iraq. The governorate, like the rest of the Kurdistan Region, has been deeply affected by recent waves of displacement resulting from the conflicts in Syria and the rest of Iraq, as well as a pervasive financial crisis affecting the public and private sectors of its economy. Due to the economic opportunities in Erbil Governorate, it hosted Syrian refugees and displaced people fleeing conflict in Syria and insurgency in other parts of Iraq. The Erbil's population estimate in 2020 is nearly 2.25 million.

Population projections for Sulaymaniyah Governorate

The Sulaymaniyah Governorate lies at the eastern side of the Kurdistan Region of Iraq, bordering with Iran. The southern part of the governorate comprises the Garmian Administration (the districts of Kalar and Kifri and a part of Khanaqeen which originally belongs to Diyala governorate). Since 2012, Sulaymaniyah has gradually received Syrian refugees that were moving from their displacement in the Duhok and Erbil Governorates. Since 2003, families displaced from the neighboring central governorates of Kirkuk, Salahaddin, and Diyala have also sought shelter in Sulaymaniyah's districts. The Sulaymaniyah's population estimate in 2020 is nearly 2.15 million.

Population projections for Duhok Governorate

The Duhok Governorate lies at the western side of the Kurdistan Region of Iraq, bordering with Turkey and Syria. It is the main entry door by road of both people and goods from these two countries. It also borders the Mosul Lake, which separates the Nineveh Governorate from Duhok. This geographic position has placed the Duhok Governorate as the principal shelter for Syrian refugees fleeing the conflict in the northern areas of Syria in 2012, as well as for families displaced after the fall of Mosul, Nineveh, in June 2014. In August 2014, after the fall of Sinjar, Duhok received large numbers of Yezidi IDPs, often fleeing and transiting through the Sinjar Mountains and Syria, before settling in the Duhok Governorate. The Duhok's population estimate in 2020 is nearly 1.65 million.

Population projections for Halabja Governorate

In June 2013, the Kurdistan Region of Iraq approved that Halabja is the fourth governorate of the region. Halabja Governorate is located at the South-East of Iraq with borders with Iran.

The Halabja's population estimate in 2020 is nearly 115 thousand.

Conclusions

- ★ Analysing the implications of population projections is important for providing a better understanding of the relation between population and sustainable development. This understanding is not only important when projections was conducted on the national level but is equally important on the local level. The population projections on the governorate/district level turned out to be important for KRI as the population dynamics varies across governorates. This applies to both fertility levels and to internal migration trends.
- ★ Differentials in fertility levels will have an impact on the future demand on education and health services, and results of the projections on the local level can help setting priorities and revising resource allocation. Investing in youth and harnessing demographic dividend is crucial given the young age structure in KRI. A full analysis of the demographic dividend in the region along with the analysis of its link to human capital and sustainable development will help building a future vision for KRI.
- ★ Urban/rural population estimation is also equally important for rural development, for reducing poverty, and for building a more inclusive society.
- ★ Migration was not fully analyzed in this report as recent data are limited and more in-depth assumptions should be developed based on economic and political scenarios that depend heavily on the regional outlook in the next coming years.
- ★ Population projections should be updated periodically (3 to 5 years) depending on the economic and political situation in KRI and on the region and its impact on population dynamics parameters.

¹⁰ Difference between scenarios appears only in the first age group, as older individuals are already born (same will apply when projecting population for the consecutive years for individuals below 10 for year 2030, for individuals below 15 for year 2035, and for individuals below 20 for year 2040.)
